Theory of Deep Learning

Xu Yuan

University of Louisiana at Lafayette

Key Elements in Neural Network

- **Activation Function**
- **Softmax Function**
- **Mathematical Expression for Network Function**
- **Learning Rate**
- **Gradient Descent**
- **Momentum**
- **Maxout**
- **Dropout**

Single Neuron

$$z = a_1 w_1 + \dots + a_k w_k + \dots + a_K w_K + b$$

Activation Function

Various Activation Function

Sigmoid: $f(x) = \sigma(x) = \frac{1}{1+e^{-x}}$

tanh: $f(x) = 2\sigma(2x) - 1$

ReLU: $f(x) = \max(0, x)$

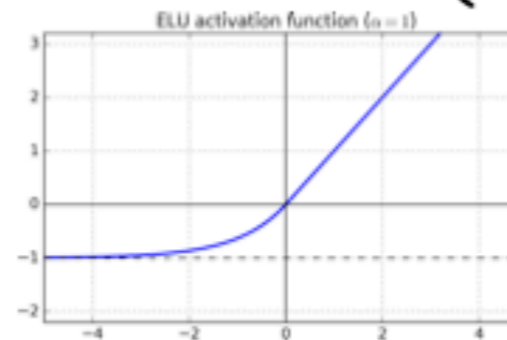

Leaky ReLU: $f(x) = \max(\alpha x, x)$

Maxout

$$\max(w_1^T x + b_1, w_2^T x + b_2)$$

$$\text{ELU: } f(x) = \begin{cases} x & x \geq 0 \\ \alpha(e^x - 1) & x < 0 \end{cases}$$

ReLU

- Rectifier Linear Unit

$$a = \max(0, z)$$

ReLU

Output Layer

- **Softmax Layer**

$$y_1 = \frac{e^{z_1}}{\sum_{j=1}^3 e^{z_j}}$$

$$y_2 = \frac{e^{z_2}}{\sum_{j=1}^3 e^{z_j}}$$

$$y_3 = \frac{e^{z_3}}{\sum_{j=1}^3 e^{z_j}}$$

```
model.add( Dense(output_dim=10) )  
model.add( Activation('softmax') )
```

```
model.add( Dense( input_dim=28*28,  
                 output_dim=500 ) )  
model.add( Activation('sigmoid') )
```

```
model2.add( Dense(output_dim=100) )  
model2.add( Activation('relu') )  
model2.add( Dense(output_dim=10) )  
model2.add( Activation('softmax') )
```

Activation Functions

$$z_i^l = w_{i1}^l a_1^{l-1} + w_{i2}^l a_2^{l-1} \dots + b_i^l$$

Relations between Layer Outputs

Relations between Layer Outputs

$$z_1^l = w_{11}^l a_1^{l-1} + w_{12}^l a_2^{l-1} + \dots + b_1^l$$

$$z_2^l = w_{21}^l a_1^{l-1} + w_{22}^l a_2^{l-1} + \dots + b_2^l$$

$$\vdots$$

$$z_i^l = w_{i1}^l a_1^{l-1} + w_{i2}^l a_2^{l-1} + \dots + b_i^l$$

$$\vdots$$

$$\begin{bmatrix} z_1^l \\ z_2^l \\ \vdots \\ z_i^l \\ \vdots \end{bmatrix} = \begin{bmatrix} w_{11}^l & w_{12}^l & \dots \\ w_{21}^l & w_{22}^l & \dots \\ \vdots & \vdots & \ddots \end{bmatrix} \begin{bmatrix} a_1^{l-1} \\ a_2^{l-1} \\ \vdots \\ a_i^{l-1} \\ \vdots \end{bmatrix} + \begin{bmatrix} b_1^l \\ b_2^l \\ \vdots \\ b_i^l \\ \vdots \end{bmatrix}$$

$$z^l = W^l a^{l-1} + b^l$$

Relations between Layer Outputs

Relations between Layer Outputs

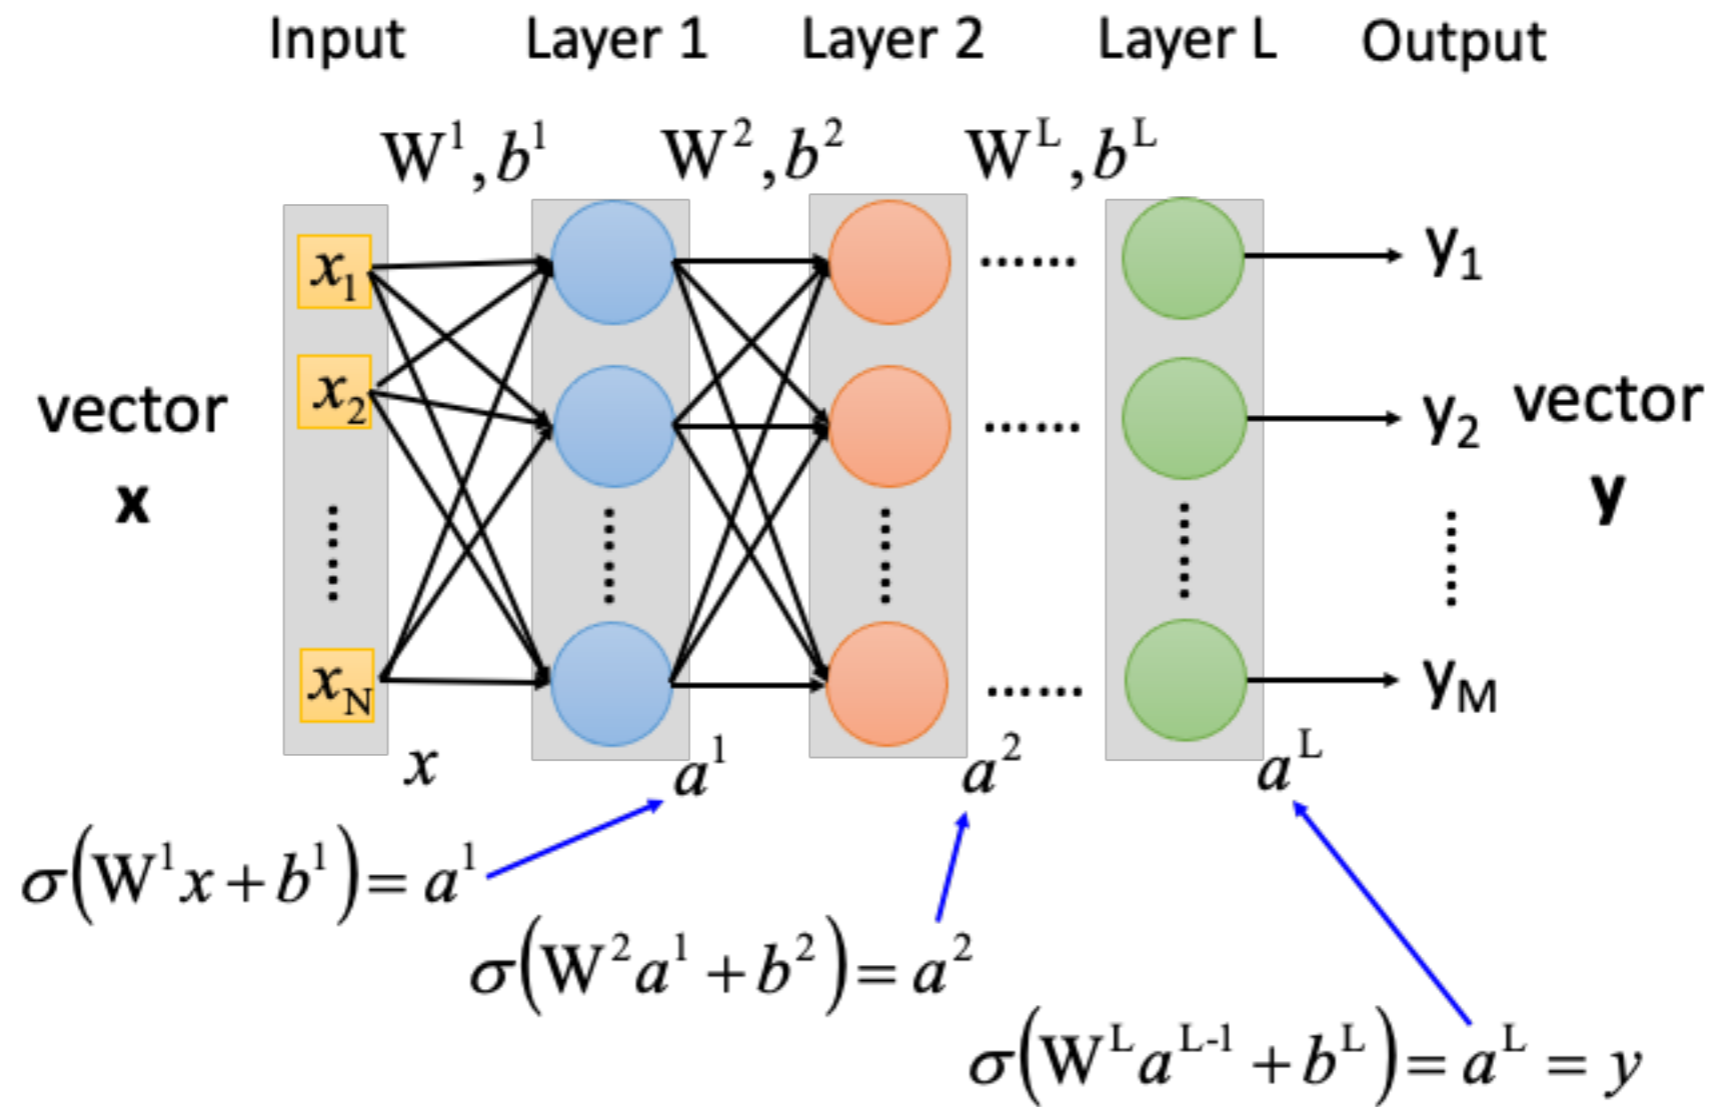

$$z^l = W^l a^{l-1} + b^l$$

$$a^l = \sigma(z^l)$$

$$a^l = \sigma(W^l a^{l-1} + b^l)$$

Functions of Neural Network

Uniform Expression

$$y = f(x)$$
$$= \sigma(W^L \dots \sigma(W^2 \sigma(W^1 x + b^1) + b^2) \dots + b^L)$$

Good Function = Loss as Small as Possible

A good function should make the loss of all examples as small as possible.

Loss can be **square error** or **cross entropy** between the network output and target

Loss Functions

- **Square Error:** $\sum_{i=1}^{10} (y_i - \hat{y}_i)^2$

```
model.compile(loss='mse',  
              optimizer=SGD(lr=0.1),  
              metrics=['accuracy'])
```

- **Cross-entropy** – $\sum_{i=1}^{10} \hat{y}_i \ln y_i$

```
model.compile(loss='categorical_crossentropy',  
              optimizer=SGD(lr=0.1),  
              metrics=['accuracy'])
```

Best Functions = best Parameters

$$y = f(x) = \sigma(W^L \dots \sigma(W^2 \sigma(W^1 x + b^1) + b^1) \dots + b^L)$$

function set

because different parameters W and b lead to different function

Formal way to define a function set:

$f(x; \theta) \rightarrow$ parameter set

$$\theta = \{W^1, b^1, W^2, b^2 \dots W^L, b^L\}$$

Pick the "best"
function f^*

Pick the "best"
parameter set θ^*

How to Determine Parameters

Find network parameters θ^* that minimize total loss L

Enumerate all possible values

Network parameters $\theta =$
 $\{w_1, w_2, w_3, \dots, b_1, b_2, b_3, \dots\}$

Millions of parameters

E.g. speech recognition: 8 layers and
1000 neurons each layer

Gradient Descent

Network parameters $\theta =$
 $\{w_1, w_2, \dots, b_1, b_2, \dots\}$

Gradient Descent

Negative  Increase w

Positive  Decrease w

Gradient Descent

$$w \leftarrow w - \eta \partial L / \partial w$$

η is called
"learning rate"

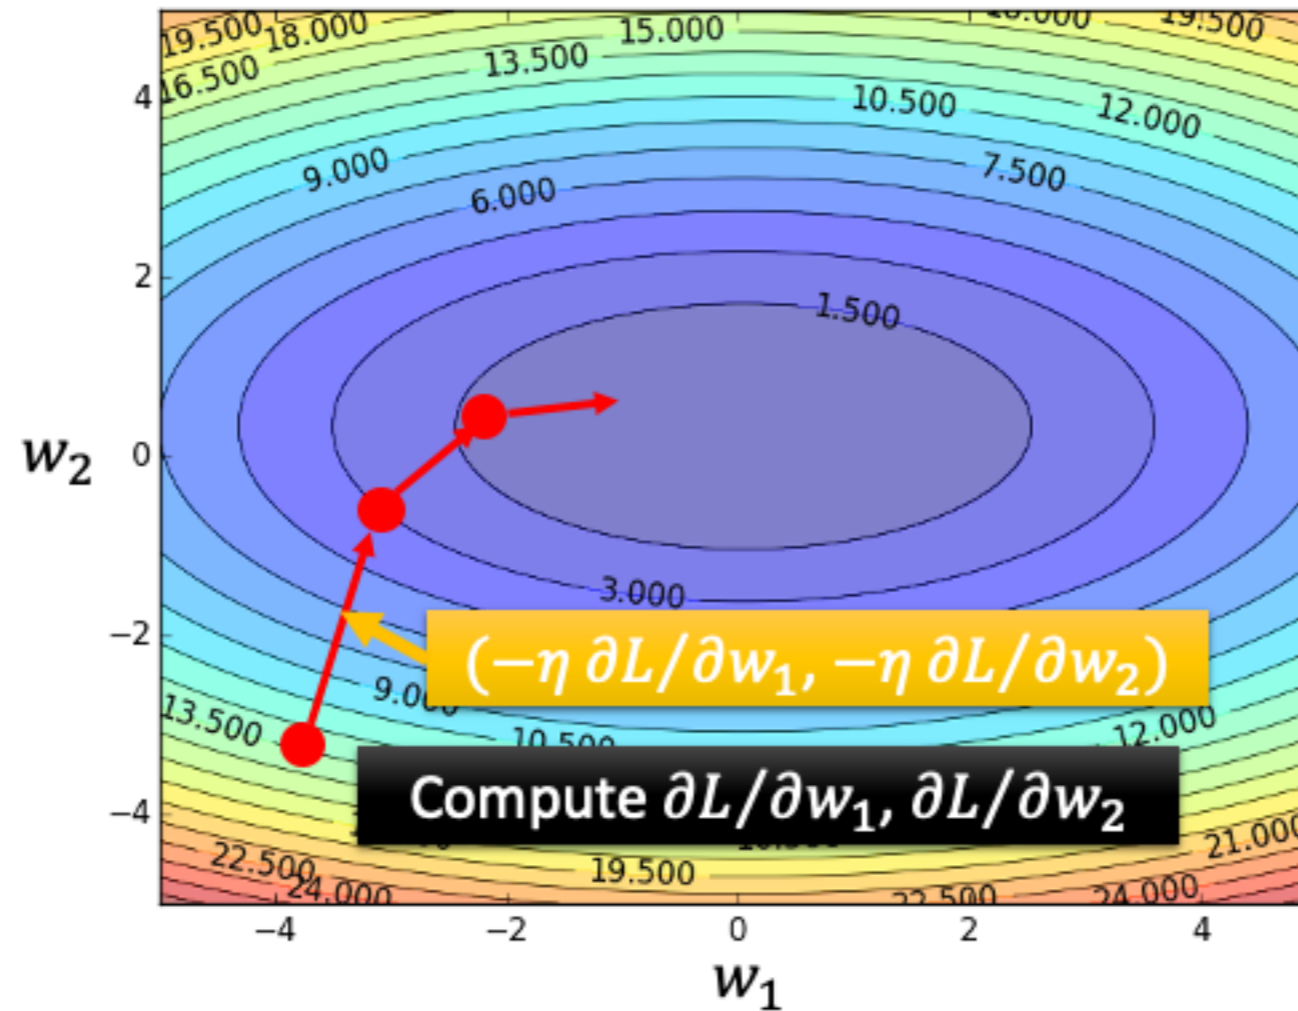

Until $\partial L / \partial w$ is approximately small

Gradient Descent

Randomly pick up a start point

Gradient Descent

Local Minima

Local Minima

Different initial points reach different local minima!

Local Minima

$$w \leftarrow w - \eta \frac{\partial L}{\partial w}$$

If learning rate is too large, total loss may not decrease

Learning Rate

$$w \leftarrow w - \eta \frac{\partial L}{\partial w}$$

If learning rate is too small, training would be too slow!

Learning Rate

- **At the beginning, we can set a large learning rate**
- **After several epochs, we reduce the learning rate**
- **Giving different parameters different learning rate**

Momentum

How about put this phenomenon in gradient descent

Momentum

```
model.compile(loss='categorical_crossentropy',  
              optimizer=SGD(lr=0.1),  
              metrics=['accuracy'])
```

```
model.compile(loss='categorical_crossentropy',  
              optimizer=Adam(),  
              metrics=['accuracy'])
```

Dropout

Training:

Each neuron has $p\%$ to dropout in each epoch!

```
model.add( dropout(0.8) )
```

Maxout

In Practice
